

The Legacy Migration Roadmap

One untouched legacy app is usually the real reason migration keeps stalling

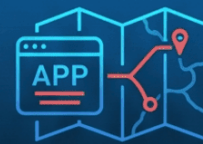

For businesses stuck on unsupported servers or applications

1. Inventory every unsupported server and OS

Every device, not just the ones IT remembers

2. Identify every legacy app still in active use

Map what depends on it before moving anything

3. Confirm vendor upgrade paths per application

Know which apps have no supported path forward

4. Capture applications into a portable package

Using EtherApps Forge, not manual reinstalls

5. Test captured apps before touching production

Validate behaviour on the target OS first

6. Sequence migration by risk, not convenience

Lowest-risk systems move first
